Pull request overview

This PR restructures the repository around the supported "local-first" runtime (Python scripts → DuckDB/dbt → Parquet export → Rill) by moving legacy deployment/runtime surfaces into `archive/` and updating docs/configuration/CI to match that supported workflow.

Changes:

- Archive unsupported legacy assets (Kubernetes, Postgres/Grafana/Superset stacks, monitoring, legacy tests/src) under `archive/` and update references accordingly.
- Align docs and dependency metadata (`pyproject.toml` , `SECURITY/CONTRIBUTING/README`) with the local-first runtime and reduced dependency surface.
- Update CI path filters and simplify the test job by removing the Postgres service.

Fix batch with Copilot

SECURITY.md

Comment on lines 105 to 110

105	105	```python
106		- # Delete records older than 7 years (FERPA requirement)
	106	+ # Example operator-managed retention job.
	107	+ # Adjust timing and legal basis to your district policy.
107	108	DELETE FROM raw_students
108	109	WHERE withdrawal_date < CURRENT_DATE - INTERVAL 7 YEARS;
109	110	```

Copilot (AI) 10 hours ago Medium ...

This fenced block is labeled as `python` but contains SQL (`DELETE FROM ...`). That makes the example harder to copy/paste and can confuse syntax highlighting. Change the fence language to `sql` or wrap the statement in an actual Python snippet that executes it via a DuckDB connection.

Comment on lines 514 to +521

526	514	```sql
527		- -- <u>Check table sizes</u>
	515	+ -- <u>DuckDB-compatible row count check for active tables</u>
528	516	SELECT
529		- table_name,
530		- COUNT(*) as row_count,
531		- pg_size_pretty(pg_total_relation_size(table_name)) as total_size
	517	+ table_schema,
	518	+ table_name
532	519	FROM information_schema.tables
533	520	WHERE table_schema = 'main'
534		- <u>GROUP BY</u> table_name;
	521	+ <u>ORDER BY</u> table_name;

Copilot (AI) 10 hours ago Medium ...

The comment says this is a "row count check" but the query only lists table schema/name and never computes row counts. Either update the comment to reflect what the query actually does or provide a DuckDB-compatible way to estimate/compute per-table row counts.

sysadminctl is macOS-specific, so this example won't work on Linux hosts (where many deployments run). Consider either labeling this explicitly as macOS or providing an OS-agnostic alternative (e.g., `useradd / adduser`) so the least-privilege guidance is actionable across platforms.

	57	+ # <code>Example pseudonymization helper</code>
58	58	import hashlib
59	59	import os
60	60	

 Copilot (AI) 10 hours ago Medium ...

The example pseudonymization helper should fail fast if `PRIVACY_SALT` is missing. As written, `os.getenv('PRIVACY_SALT')` can be `None`, producing a deterministic hash with the literal string "None" as the salt, which is unsafe guidance for privacy-sensitive deployments.

 Copilot (AI) 10 hours ago High ...

With the expanded path filters, this workflow will run more often, but the `contract-tests` job still requires a readable DuckDB file at `oss_framework/data/oea.duckdb`. The repository only contains placeholder directories under `oss_framework/data/` (no `oea.duckdb`), so the contract job will consistently fail with "DuckDB file not found" unless the workflow creates/populates the DB first or the contract runner treats a missing DB as a skip/JSON-only validation mode.
